Example – Pick-and-Place Robot Arm

- Applications in warehouses, manufacturing, and medical industries
- RST: robot model, plan, control, and simulate robot
- MPC: trajectory optimization
- Stateflow: task-level planning and execution

Navigation is critical for autonomous systems

Qualcomm

Autonomous Robotics

Overcoming obstacles in autonomous path planning and navigation.

We have developed **autonomous path planning and navigation systems** for drone and robots, enabling them to move safely through indoor and outdoor environments. For example, prior to flight, the user designates where the drone should go and the bounds of the area it will fly through. The drone's path planning algorithm uses a 3D model of the world (generated through voxel mapping) to build a random graph of unoccupied points in space and safely transitions between them. The graph represents all the collision-free paths the drone could select to reach its goal. The drone may see multiple paths but will pick the shortest path to its destination. Every hundred milliseconds, it updates its 3D voxel map and re-checks the planned path to ensure it is still safe. If at some point the drone encounters a potential hazard or obstacle in its path, it will re-vector to an alternate route based upon its internal decision-making

Navigation Tools

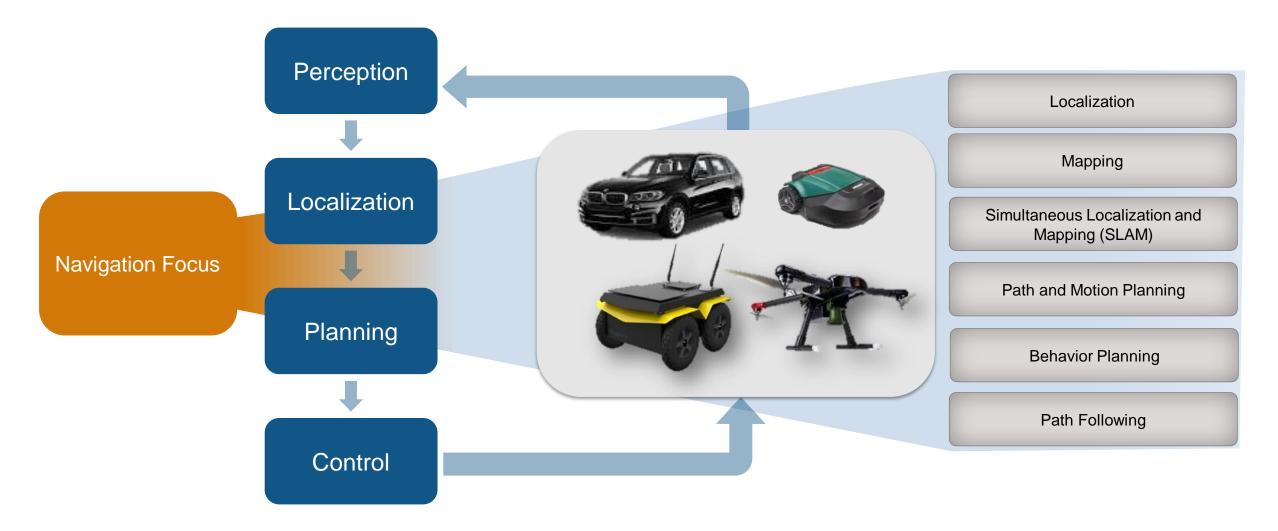

- Where am I going?
- What's the best way there?
- Where have I been?
- Where am I on map?
- What if you don't have a map?

Behavior Planning Path / Motion Planning Mapping Localization SLAM

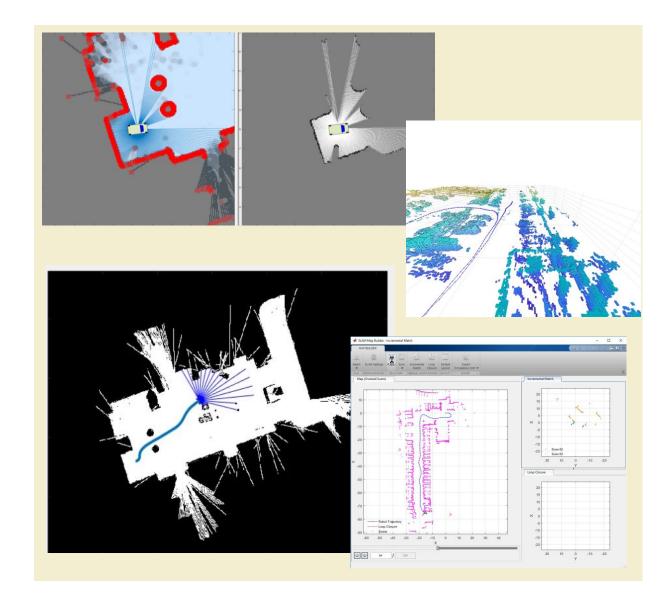

Autonomous Navigation Workflow

Navigation Toolbox

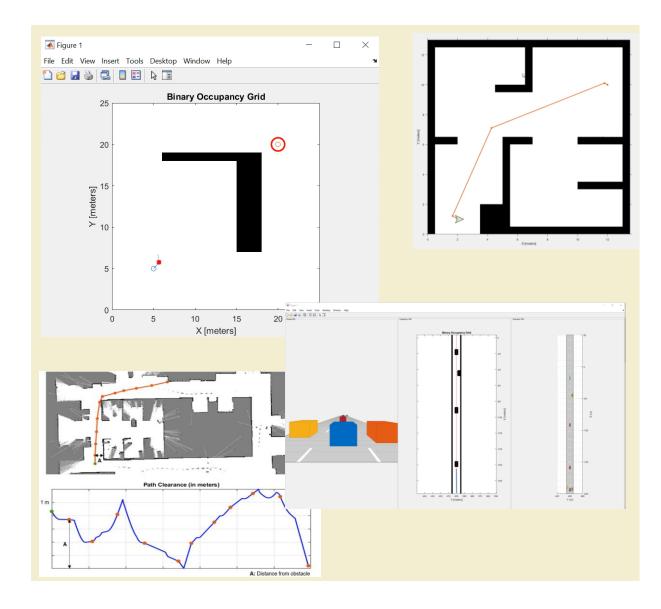

- Mapping and localization
 - 2D and 3D SLAM
 - Egocentric maps
 - SLAM map builder App

Navigation Toolbox

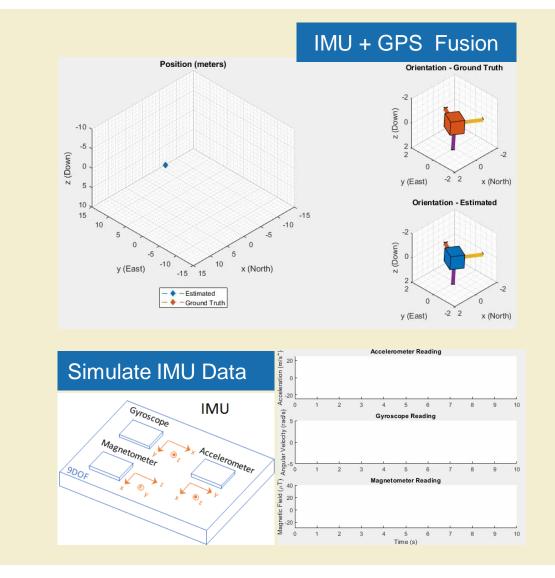

- Mapping and localization
 - 2D and 3D SLAM
 - Egocentric maps
 - SLAM map builder App
- Path planning and Following
 - Algorithms for path planning
 - Planner interface
 - Path metrics
 - Path following and controls

Navigation Toolbox

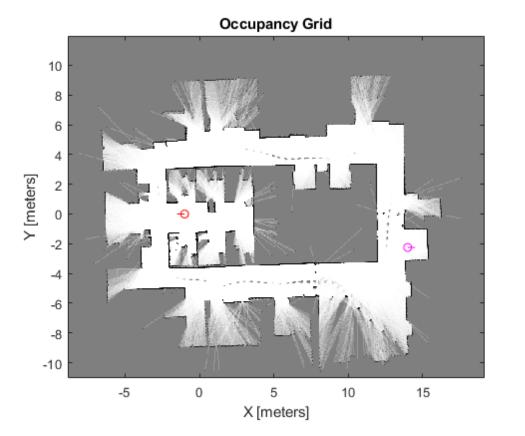

- Mapping and localization
 - 2D and 3D SLAM
 - Egocentric maps
 - SLAM map builder App
- Path planning and Following
 - Algorithms for path planning
 - Planner interface
 - Path metrics
 - Path following and controls
- Sensor modeling and simulation
 - IMU, GPS, INS sensors

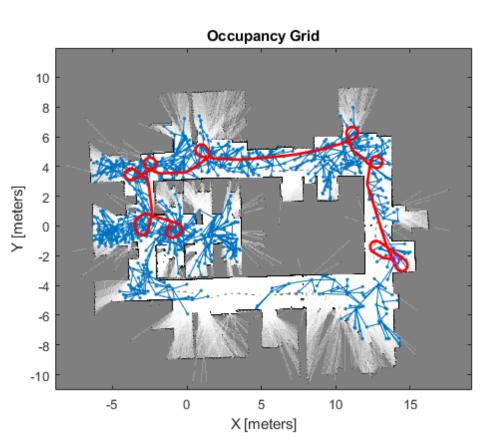

Example – Plan Mobile Robot Paths using RRT

- Load an existing occupancy map of a small office space
- Specify the state space of the vehicle
- Plan a path for a vehicle

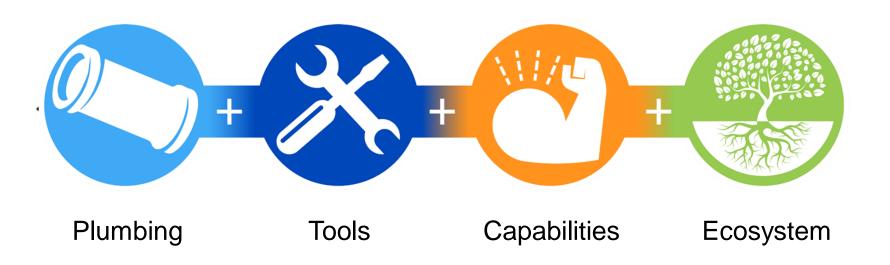

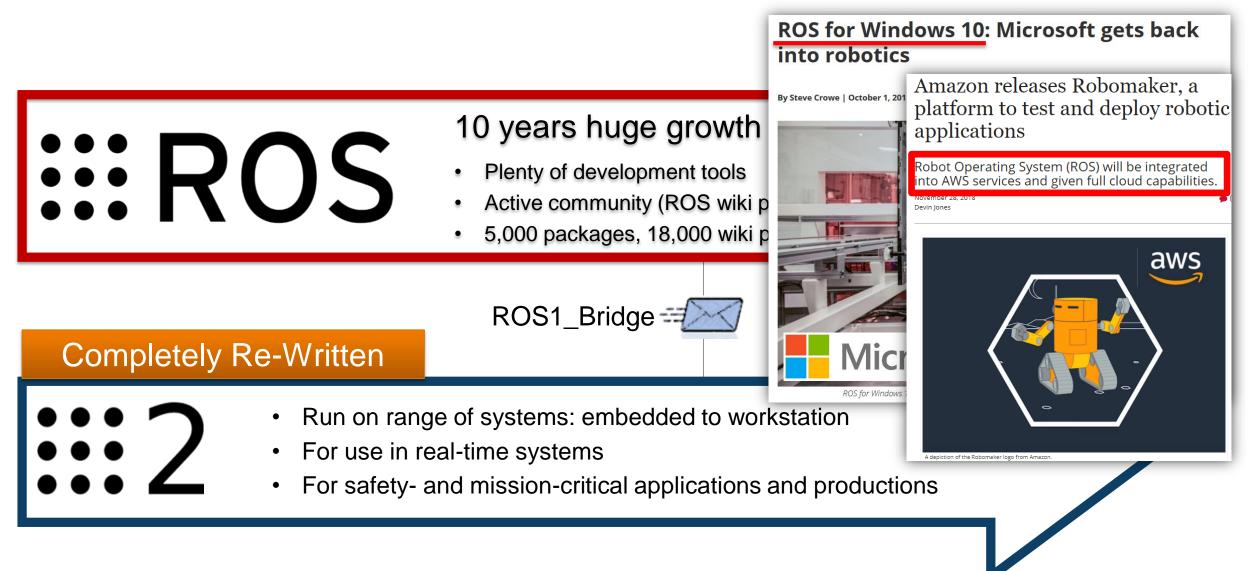

ROS – A Distribution in Software for Automation

- Open Source
- Established to prevent re-inventing the wheel
- Maintained by Open Robotics
- Reusable Software Components
- >1,000,000 user downloads/mo

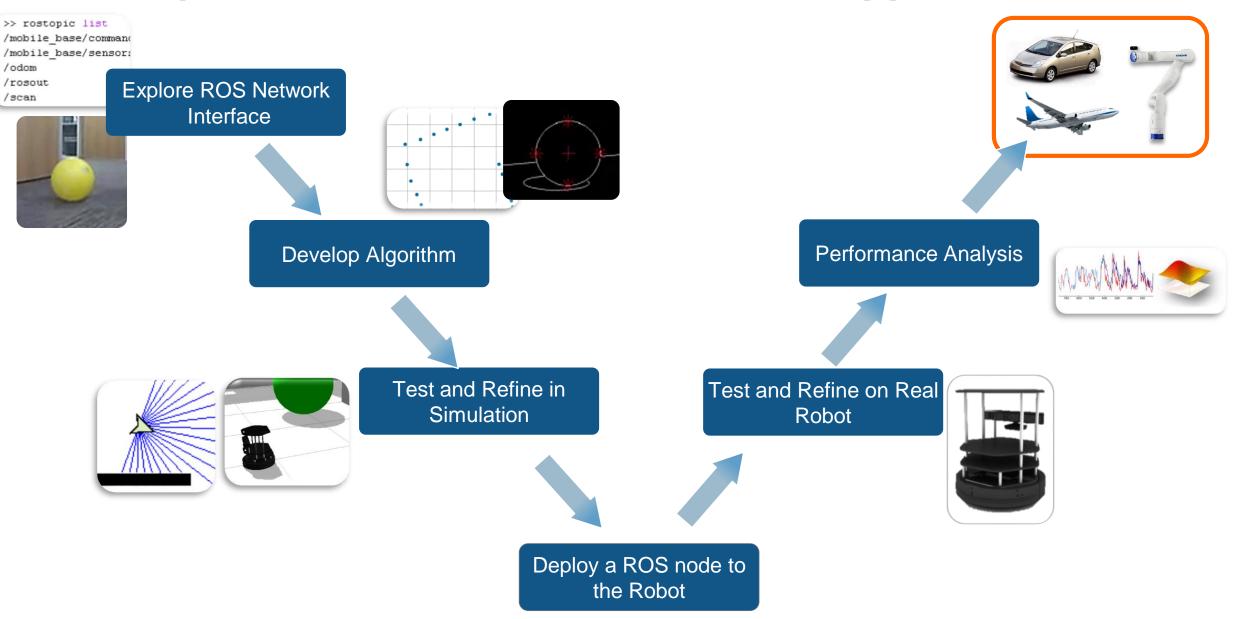

Why ROS? Growth and Adoption of ROS

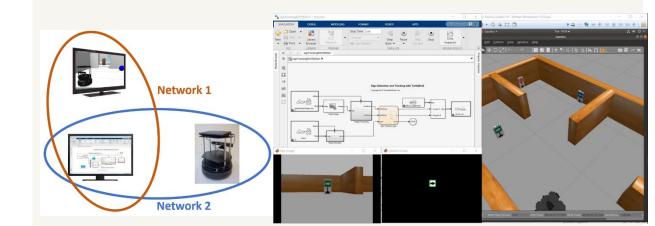

Development Workflow for ROS-based Applications

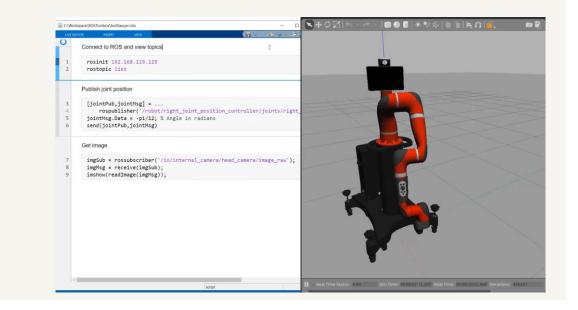

ROS Toolbox

- ROS network and communication
 - Live connectivity from MATLAB and Simulink to ROS and ROS2

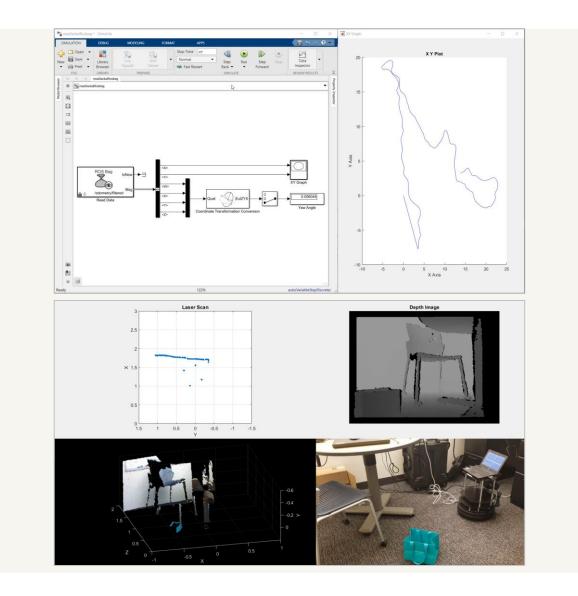

ROS Toolbox

- ROS network and communication
 - Live connectivity from MATLAB and Simulink to ROS and ROS2
- ROS Message
 - rosbag data import and playback
 - Specialized ROS message

ROS Toolbox

- ROS network and communication
 - Live connectivity from MATLAB and Simulink to ROS and ROS2
- ROS Message
 - rosbag data import and playback
 - Specialized ROS message
- ROS node generation
 - Node generation from Simulink for prototyping and deploying autonomous systems
